Lab 3 Report

Preparation:

-As you might know, the default code execution fails to play audio despite the state machine works without an error. This can be solved (band aid solution) by changing the voice from Web Interface GUI. I am curious about the source of this problem.

Part A:

1- Created gestures manually, following "https://docs.furhat.io/remote-api/#gesturedefinition", tried out and played with BasicParams and their values. Namely, eyeRollGesture and thinkingGesture. blocking=false to wait for the other execution to finish before firing other states.

Note: Although the docs specify that the values should be between 0 and 1, the values can be exceeded. Resulting in extreme gestural positions. (funny)

2- Followed "https://docs.furhat.io/remote-api/#furhatattend", made a function for the closest person with, http://${FURHATURI}/furhat/attend?user=CLOSEST, calling the function in the first state AttendUser.

Note: How would we cancel this attending skill in a specific state if we want to?

3- Made a simple state machine and wrote a simple monologue.

4- Made surprisedWithAudioGesture following the first step. But this time, included await fhSay(""); Thus, executing fhSay simultaneously. Later added a similar line to thinking gesture.
